

# INFORMATION SHEET

# Megawet™

## ADJUVANT

To improve spray coverage for a range of plant growth regulators and crop protection products.

## SAVE TIME AND MONEY WITH LOWER WATER

Post emergent spraying of maize can now be carried out using 100 litres per ha rather than the traditional 200 litres per ha. This can be achieved with the addition of MEGAWET™ to the spray mix.

Independent trials carried out last season have shown no reduction in effectiveness when using 100 litres as opposed to 200 litres per ha.

Dynamic Surface Tension is decreased meaning better adhesion of the droplet onto the plant surface. Unlike conventional organosilicones, MEGAWET™ will not cause stomatal flooding which can harm crops.

Lower water rates saves filling time and water cartage which means cost savings and faster spray-out times - meaning more ha per day !!

100 ml/ha is all that is required to reduce rates from 200 litres/ha to 100 litres/ha at a cost of about \$3.20/ha.
